Cement Silos

Cement silos are the types of machines used to store the cement required for concrete plants. Silos, which are produced in different capacities according to the needs of concrete production facilities, generally have a storage capacity of 25 to 3000 tons.

Cement silo is a necessary business tool for companies that need cement continuously. There are different pad types that allow the cement to flow easily when needed. These products, which are effective in preserving the cement before it dries, although it was first prepared, can consist of single, double or triple chambers depending on their capacities.

Our **cement silos** generally range from **25 / ton** to **3000 / ton**. We can change these capacities according to the cement silo needs of your concrete production facility.

All cement fleets produced by our company have 1 pressure relief valve, 3 air jets, 1 24m2 cartridge filter. In addition to these, thanks to the cement level meter in each silo, you can add materials urgently when there is less cement than you need and continue your services without a break.
